Edited by Burton H. Singer, University of Florida, Gainesville, FL, and approved August 6, 2015 (received for review April 2, 2015)

The recent emergence of dengue viruses into new susceptible human populations throughout Asia and the Middle East, driven in part by human travel on both local and global scales, represents a significant global health risk, particularly in areas with changing climatic suitability for the mosquito vector. In Pakistan, dengue has been endemic for decades in the southern port city of Karachi, but large epidemics in the northeast have emerged only since 2011. Pakistan is therefore representative of many countries on the verge of countrywide endemic dengue transmission, where prevention, surveillance, and preparedness are key priorities in previously dengue-free regions. We analyze spatially explicit dengue case data from a large outbreak in Pakistan in 2013 and compare the dynamics of the epidemic to an epidemiological model of dengue virus transmission based on climate and mobility data from ~40 million mobile phone subscribers. We find that mobile phone-based mobility estimates predict the geographic spread and timing of epidemics in both recently epidemic and emerging locations. We combine transmission suitability maps with estimates of seasonal dengue virus importation to generate fine-scale dynamic risk maps with direct application to dengue containment and epidemic preparedness.

dengue | human mobility | Pakistan | mobile phones | epidemiology

Dengue is the most rapidly spreading mosquito-borne disease worldwide (1, 2). Half the global population now lives in at-risk regions for dengue virus transmission, due to the wide distribution of the mosquito vector, *Aedes aegypti*, which thrives in peri-urban areas and transmits the virus between humans (3). Dengue virus can cause acute febrile illness and carries the risk of severe disease, hospitalization, and shock syndrome, especially in clinical settings with little experience treating dengue patients. There is currently no specific therapeutic protocol for, or vaccine against, infection (1). Current control measures focus on vector control, although these measures are often logistically difficult and have shown varying efficacy in controlling epidemics (4). In the absence of effective prevention and treatment, public health system preparedness remains the single most important tool for minimizing morbidity and mortality as dengue epidemics spread beyond endemic areas (5, 6).

The introduction of dengue into new populations is mediated by travel of infected individuals to areas that can support transmission, because mosquito vectors move only short distances during their lifespans (3, 7–12). International travel to endemic countries has resulted in imported cases and outbreaks in Europe and the Americas (2, 8, 10, 13). Local variation in transmission, within a single city for example, is also driven by mobility patterns of individuals on short timescales (7). Forecasting methods are needed to spatially target interventions and epidemic preparedness measures that reflect both the changing temporal risks of importation and environmental suitability that go beyond solely climate-based methods (14).

Dengue has long been endemic in most Southeast Asian countries (1), but has more recently emerged in parts of the Middle East and South Asia, including Pakistan (15, 16). In Pakistan, the transmission of dengue viruses was largely confined to the southern city of Karachi until 2011 when a large dengue epidemic with over 20,000 cases occurred in the northeastern city of Lahore (16), causing significant morbidity and mortality. In 2013, a second large epidemic occurred in northeastern Pakistan in Punjab and Khyber-Pakhtunkhwa (KP) provinces, establishing the region as an emerging focus of seasonal dengue epidemics. It has been hypothesized that the recent geographic expansion of *A. aegypti* mosquito vectors, changing environmental suitability, and human importation of dengue from endemic regions all contributed to the emergence of dengue in northern areas (17). Pakistan is therefore representative of many countries that are on the verge of countrywide endemic dengue transmission and are struggling to contain its emergence into previously dengue-free regions.

Measuring changing risks of importation events that spark epidemics has been extremely challenging on the refined temporal and spatial scales necessary to inform local policies (18). Being able to predict when to prepare surveillance systems and health facilities for dengue outbreaks could dramatically reduce the morbidity and mortality associated with epidemics and would allow policy makers to pinpoint regions that are particularly vulnerable to imported cases, for vector control. Mobile phone data offer direct measures of human aggregation and movement

## Significance

Dengue virus has rapidly spread into new human populations due to human travel and changing suitability for the mosquito vector, causing severe febrile illness and significant mortality. Accurate predictive models identifying changing vulnerability to dengue outbreaks are necessary for epidemic preparedness and containment of the virus. Here we show that an epidemiological model of dengue transmission in travelers, based on mobility data from ~40 million mobile phone subscribers and climatic information, predicts the geographic spread and timing of epidemics throughout the country. We generate fine-scale dynamic risk maps with direct application to dengue containment and epidemic preparedness.

Cradock, Kawachi et al. *Am J Prev Med* 2005

# Broken window theory

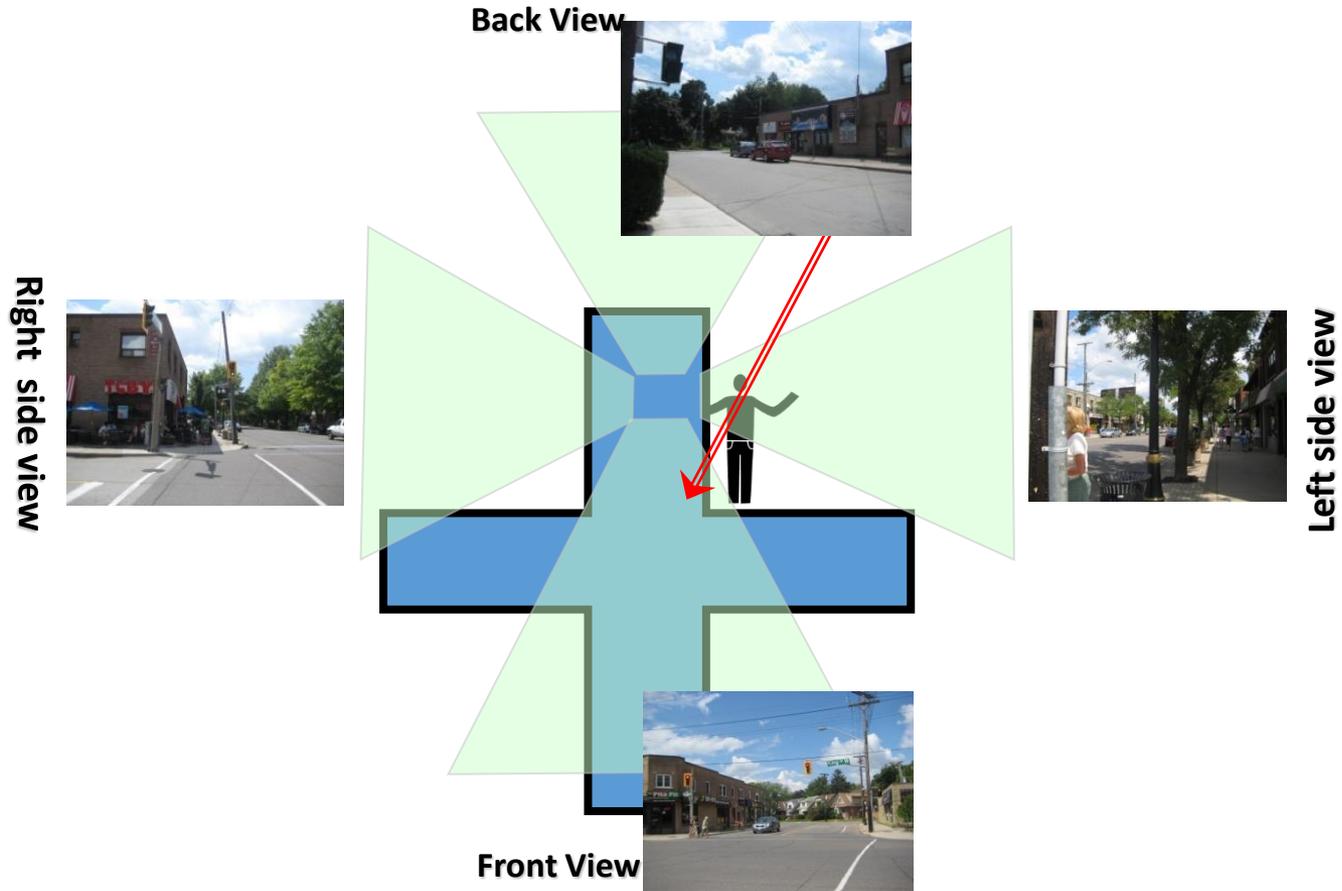

- “Consider a building with a few broken windows. If the windows are not repaired, the tendency is for vandals to break a few more windows. Eventually, they may even break into the building, and if it's unoccupied, perhaps become squatters or light fires inside. Or consider a sidewalk. Some litter accumulates. Soon, more litter accumulates. Eventually, people even start leaving bags of trash from take-out restaurants there or even break into cars.”
- A "broken windows" index measured housing quality, abandoned cars, graffiti, trash, and public school deterioration.
  - In high-poverty neighborhoods, block groups with high broken windows scores had significantly higher gonorrhea rates than block groups with low broken windows scores (46.6 per 1000 vs 25.8 per 1000;  $P < .001$ ).
  - The broken windows index explained more of the variance in gonorrhea rates than did a poverty index measuring income, unemployment, and low education.

# Greece's health crisis: from austerity to denialism

*Alexander Kentikelenis, Marina Karanikolos, Aaron Reeves, Martin McKee, David Stuckler*

**Lancet 2014; 383: 748–53**

Department of Sociology and  
King's College, University of  
Cambridge, Cambridge, UK  
(A Kentikelenis MPhil);

European Centre on Health of  
Societies in Transition, London  
School of Hygiene and Tropical

Greece's economic crisis has deepened since it was bailed out by the international community in 2010. The country underwent the sixth consecutive year of economic contraction in 2013, with its economy shrinking by 20% between 2008 and 2012, and anaemic or no growth projected for 2014. Unemployment has more than tripled, from 7·7% in 2008 to 24·3% in 2012, and long-term unemployment reached 14·4%. We review the background to the crisis, assess how austerity measures have affected the health of the Greek population and their access to public health services, and examine the political response to the mounting evidence of a Greek public health tragedy.

# Macroeconomic conditions and problem drinking

- Current recession coincided with 20% increase in alcoholism related searches
- 5% increase in unemployment associated with 15% increase in searches within 12 months

*(Frijters et al. 2011)*

In addition to seeing ads based on your interests, you may also see ads based on the types of sites you visit."

A sign of loyalty?

# Long distance pregnancy testing?

“[Pole] ran test after test, analyzing the data, and before long some useful patterns emerged. Lotions, for example. Lots of people buy lotion, but one of Pole’s colleagues noticed that women on the baby registry were buying larger quantities of unscented lotion around the beginning of their second trimester.

Another analyst noted that sometime in the first 20 weeks, pregnant women loaded up on supplements like calcium, magnesium and zinc. Many shoppers purchase soap and cotton balls, but when someone suddenly starts buying lots of scent-free soap and extra-big bags of cotton balls, in addition to hand sanitizers and washcloths, it signals they could be getting close to their delivery date.”

## Even before your family know?

““My daughter got this in the mail!” he said. “She’s still in high school, and you’re sending her coupons for baby clothes and cribs? Are you trying to encourage her to get pregnant?”

The manager didn’t have any idea what the man was talking about. He looked at the mailer. Sure enough, it was addressed to the man’s daughter and contained advertisements for maternity clothing, nursery furniture and pictures of smiling infants.

The manager apologized and then called a few days later to apologize again.

On the phone, though, the father was somewhat abashed. “I had a talk with my daughter,” he said. “It turns out there’s been some activities in my house I haven’t been completely aware of. She’s due in August. I owe you an apology.”

### Ethical issues in using social media for health and health care research

Rebecca McKee

*Institute for Social Change, University of Manchester, 2.11 Humanities, Bridgeford Street, Manchester M13 9PL, United Kingdom*

#### ARTICLE INFO

*Keywords:*  
Social media  
Ethics

#### ABSTRACT

The dramatic growth of social media in recent years has not gone unnoticed in the health sector. Media such as Facebook and Twitter are increasingly being used to disseminate information among health professionals and patients but, more recently, are being seen as a source of data for surveillance and research, for example by tracking public concerns or capturing discourses taking place outside traditional media outlets. This raises ethical issues, in particular the extent to which postings are considered public or private and the right to anonymity of those posting on social media. These issues are not clear cut as social media, by their nature, blur the boundary between public and private. There is a need for further research on the beliefs and expectations of those using social media in relation to how their material might be used in research. In contrast, there are areas where the ethical issues are more clear cut, such as when individuals are active participants in research, where traditional considerations apply.

# Umar Farouk Abdulmutallab

- Abdulmutallab's father had alerted US authorities previously
- Separately, his name was added to the 550,000 on the National Counterterrorism Database
- But no-one informed the FBI no-fly list
- Abdulmutallab :
  - bought ticket, with cash
  - boarded without a passport
  - noted to be acting suspiciously at gate
- Janet Napolitano (Secretary of Homeland Security)
  - Day 1: "once the incident occurred, the system worked" She cited "
  - Day 2: the system "failed miserably"

**Problem: lost needle in haystack**  
**Solution: get more hay**

# Conclusion

- New sources of data offer many opportunities
- But we need to address the complicated ethical issues
  - In a world where people are happy to post their most intimate details on line
  - And where those seeking to make the world a better place are severely disadvantaged to those whose products kill
- And remember that:
  - Data are not stamps, to be collected for the sake of it (with apologies to philatelists)
  - We should learn from the (very many and frequent) mistakes of others (recognising their liberal use of official secrecy to cover them up)
  - No matter where we get our data from, the same principles of avoiding bias apply

# Sustainable prevention of obesity through integrated strategies: The SPOTLIGHT 1 conceptual framework and design

Jeroen Lakerveld<sup>1\*</sup>, Johannes Brug<sup>1</sup>, Sandra Bot<sup>1</sup>, Pedro J Teixeira<sup>2</sup>, Harry Rutter<sup>3</sup>, Euan V Odrun Samdal<sup>3</sup>, Lynn Stockley<sup>4</sup>, Ilse De Bourdeaudhuij<sup>5</sup>, Patricia van Assema<sup>6</sup>, Aileen R Jean-Michel Oppert<sup>11</sup>, Róza Ádány<sup>12</sup> and Giel Nijpels<sup>1</sup> on behalf of the SPOTLIGHT cons

## Abstract

**Background:** The prevalence of overweight and obesity in Europe is high. It is a major cause of many of the main chronic (or non-communicable) diseases in this region and is characterised by socio-economic distribution within the population. Obesity is largely determined by modifiable factors such as low physical activity levels, sedentary behaviour and consumption of energy dense foods. It is recognised that effective responses must go beyond interventions that only focus on individual and environmental level and instead embrace system-based multi-level intervention strategies (SPOTLIGHT) aims to increase and combine knowledge on the wide range of modifiable factors at a systematic way, and to identify multi-level intervention approaches that are strong in terms of Adoption, Implementation and Maintenance (RE-AIM).

**Methods/Design:** SPOTLIGHT comprises a series of systematic reviews on: individual-level behaviour change obesity interventions; social and physical environmental determinants of obesity; RE-AIM of multi-level interventions. An interactive web-atlas of currently running multi-level interventions, and enhancing and impeding factors for implementation will be described. At these elements will inform the development of methods to assess obesogenicity of diverse remote imaging techniques linked to geographic information systems. The validity of these methods will be evaluated using data from surveys of health and lifestyles of adults residing in the neighbourhood both the micro- and macro-levels (national and international) the different physical, socio-cultural elements will be assessed.

**Discussion:** SPOTLIGHT offers the potential to develop approaches that combine an understanding of obesogenicity of environments in Europe, and thus how they can be improved, with an understanding of individual factors that explain why people respond differently to such environments. Its findings will be used by governmental authorities and professionals, academics, NGOs and private sector stakeholders to develop and implement policies to tackle the obesity epidemic in Europe.

## Abstract

**Background:** Understanding which physical environmental factors affect adult obesity, and how they are related to public health and urban planning. Previous attempts to summarise the systematically assessed the methodological quality of included studies, or accounted for environment across continents or the ways in which environmental characteristics were measured.

**Methods:** We have conducted an updated review of the scientific literature on associations of environmental factors with adult weight status, stratified by continent and mode of measurement. A detailed risk-of-bias assessment. Five databases were systematically searched for studies published between 1980 and 2013.

**Results:** Two factors, urban sprawl and land use mix, were found consistently associated with adult weight status, only in North America.

**Conclusions:** With the exception of urban sprawl and land use mix in the US the results of this review confirm that the available research does not allow robust identification of ways in which the physical environment affects adult weight status, even after taking into account methodological quality.

**Keywords:** Review, Physical environment, Overweight, Obesity, Adults, Quality assessment

## Background

Obesity prevention is a global public health priority as a result of the worldwide increase in obesity prevalence [1] and its associated chronic diseases [2]. Although genetic factors may underlie the propensity of individuals to become obese [3], the pace at which obesity prevalence has grown at population level during recent decades points to social and environmental causes [4,5]. An individual's body mass index (BMI) is mainly determined by energy intake (eating) and energy expenditure (physical activity/sedentary behaviour). These energy

balance related behaviours (EBR) range of determinants [6]. One determinant is the opportunistic calorific expenditure or a lack of the calorific. For example, dietary choices are influenced by access to different types of outlets and services. Sin levels may be influenced by access to sports facilities, green spaces or port infrastructure and land use. These factors may be more likely to promote weight gain in individuals or populations [5], but to identify the physical environment's greatest impacts on the development and obesity.

Free geospatial services

## ABSTRACT

We performed a systematic literature review on the use of free geospatial services as potential tools to assess built environmental characteristics related to dietary behaviour and physical activity. We included 13 studies, all published since 2010 and conducted in urban contexts, with Google Earth and Google Street View as the two main free geospatial services used. The agreement between virtual and field audit was higher for items related to objectively verifiable measures (e.g. presence of infrastructure and equipment) and lower for subjectively assessed items (e.g. aesthetics, street atmosphere, etc.). Free geospatial services appear as promising alternatives to field audit for assessment of objective dimensions of the built environment.

## 1. Introduction

There is increasing interest in identifying the characteristics of built environments that are potentially related to health-promoting or unhealthy dietary and physical activity patterns, which are associated with prevention of excess weight and chronic diseases (Chow et al., 2009; Feng et al., 2010; Townsend and Lake, 2009). The built environment is generally understood as the totality of places built or designed by humans, including buildings, spaces around buildings, layout of communities, transport infrastructure, and parks and trails (Transportation Research Board, 2005).

In explaining dietary and physical activity behaviours in terms of the environment it is important to capture both its objective physical characteristics and subjective assessments of it, in other words how the environment is perceived by those who inhabit it (Chow et al., 2009; Saelens and Glanz, 2009). Subjective measures are usually

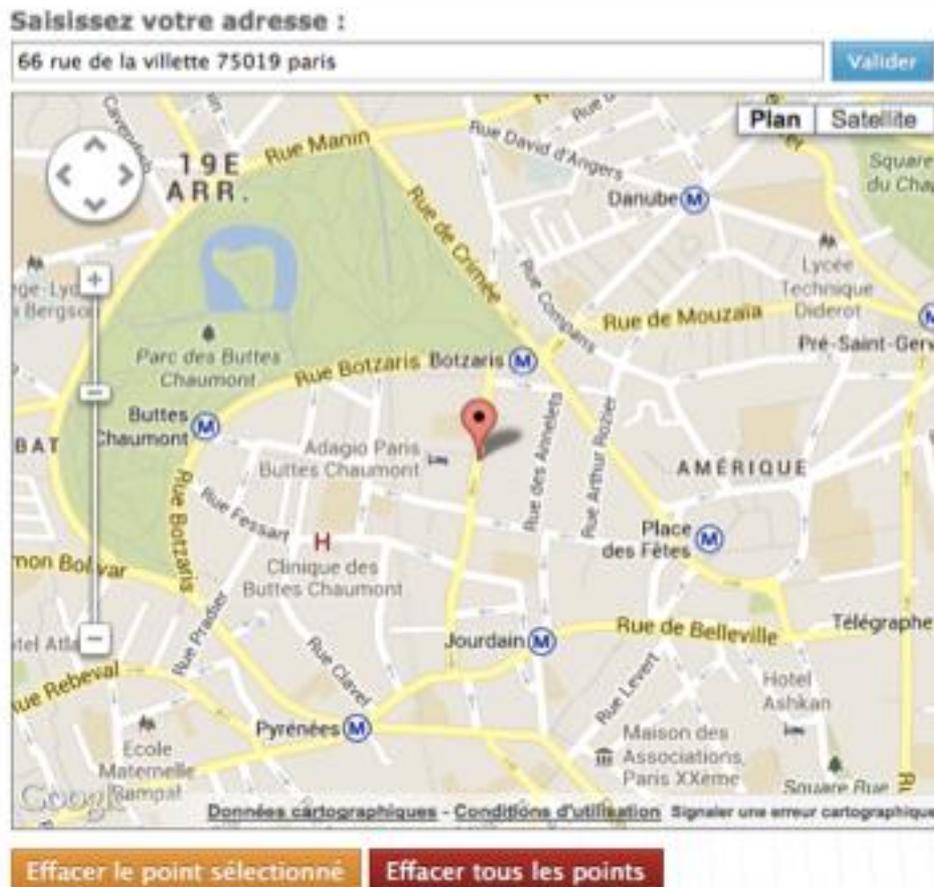

obtained from surveys of those who inhabit the environment in question, using questionnaires or in-depth interviews. Field audits, which involve observers with checklists documenting specific aspects of the built environment (Chow et al., 2010; Pomeroy et al., 2013), and geocoded data from geographic information systems (GIS), are usually considered as providing objective measures (Brownson et al., 2009).

Direct observation ('on foot' environmental audit or 'field audit') requires a visit to each area, facility or street to observe and rate characteristics of the built environment. These tools assess environmental dimensions such as land use, presence of infrastructure for active transport, and aesthetics, using differing numbers of items (from about 20 to more than 120 depending on the instrument). The time needed to administer them ranges from 75 to 115 min. A list of commonly used audit instruments can be found at <http://activelivingresearch.org/>. Especially for broad-scale, or geographically dispersed, studies field audit may be an expensive, time-consuming and cumbersome method. However, the advent of new, freely available, remote sensing technologies provided by Google and more recently by Microsoft has been seen as offering new possibilities to obtain geo-spatial data collection,

Report a problem

- 12 neighbourhoods per country in 5 countries
- Aimed for 100 respondents/neighbourhood
- Sample of 6,000
- Approx 40 questions, some in multiple parts
- Average completion time around 30 minutes
- Paper version available on request
- Overall response rate around 10%

These questions are about how you *commute to and from work (or school)*.

- During the last 7 days, on how many days did you commute to and from work by public transport, car / moped / motorbike, bicycle or on foot?
- On average, how much time did you usually spend on one of those days commuting to and from work by public transport, car / moped / motorbike, bicycle or on foot?
- Why did you choose this mode of transport for commuting to and from work?

Mode of transport	Days per week commuting in the last seven days	Time spend on commuting on an average day		Most important reason
		Hours	Minutes	
Public Transport	2	1	less than 10	The environment is unpleasant or unsafe to walk / cycle in
Car / moped / motorbike				
Bicycle				
Walking

“Our home neighbourhoods, along with the places where we work, study, shop, travel and spend the rest of our time, have complex influences on our behaviour, with multiple factors acting in different ways, on different people and in different contexts. These factors only rarely follow a simple linear causal chain in which a single determinant is directly associated with a single outcome.”

**Experts say warnings that made patients stop taking vital drug have put lives at risk**

# DON'T GIVE UP YOUR STATINS

By **Ben Spencer**  
Medical Correspondent

**MORE than 200,000 patients stopped taking statins because of fears over side-effects, experts said last night.**

They estimate that as a result at least 500 lives will be lost by 2024.

Campaigning medical journals with 'an axe to grind' were blamed for having misled both patients and their doctors.

Taken by up to ten million Britons a year to cut cholesterol and ward off heart disease, statins are said to save around 7,000 lives annually.

However there is controversy over side-effects that include muscle pain, nosebleeds, headaches and higher risk of type 2 diabetes.

The experts from the London School of Hygiene and Tropical Medicine logged a 219,000 drop-off in statin usage from October 2013.

That was at the peak of the row about the potential problems with the drugs.

The blip lasted around six months - after which most patients resumed their treatment.

The research team said however even this short period could be responsible for at least 2,200 extra strokes and heart attacks in the decade up to 2024, killing more than 500 people.

They blame papers published by the British Medical Journal in late 2013 that claimed the risks of taking statins were far more serious

Debut baby: Andy Murray's four-month-old daughter Sophia makes her first appearance at Wimbledon yesterday

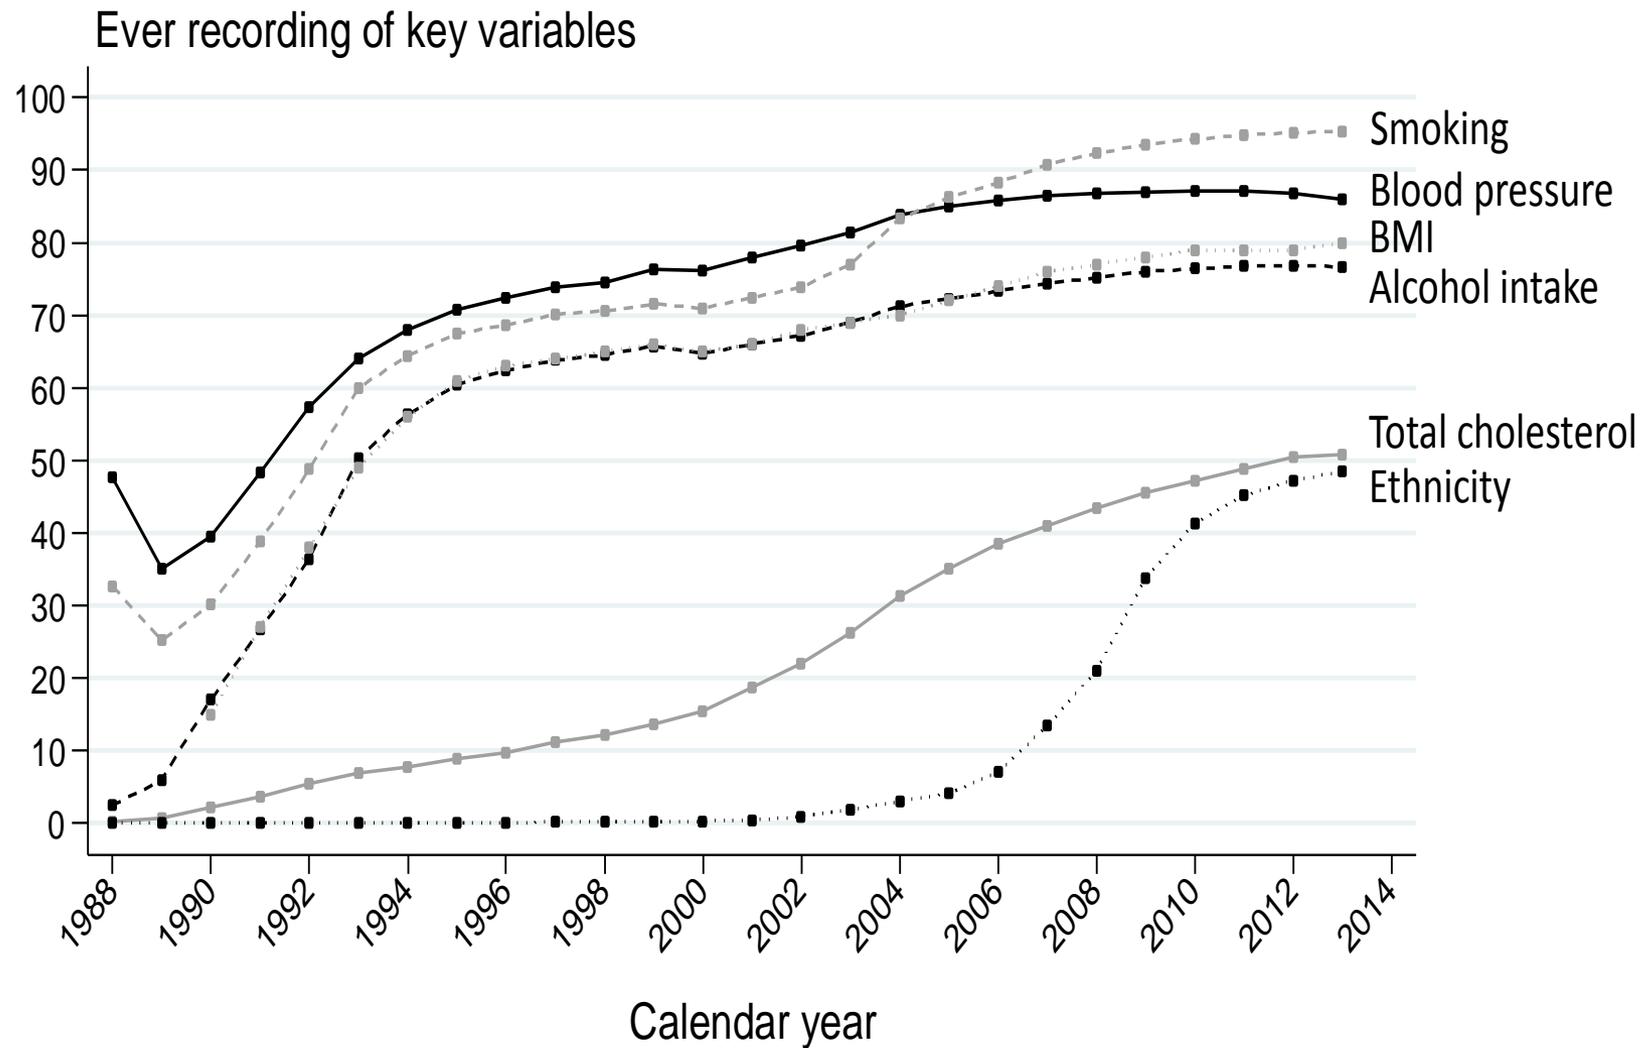

# Body mass index and cancer

Bhaskaran K, Douglas I, Forbes H, dos-Santos-Silva I, Leon D, Smeeth L. Body mass index and risk of 22 specific cancers: a population-based cohort study of 5.2 million UK adults. Lancet 2014.

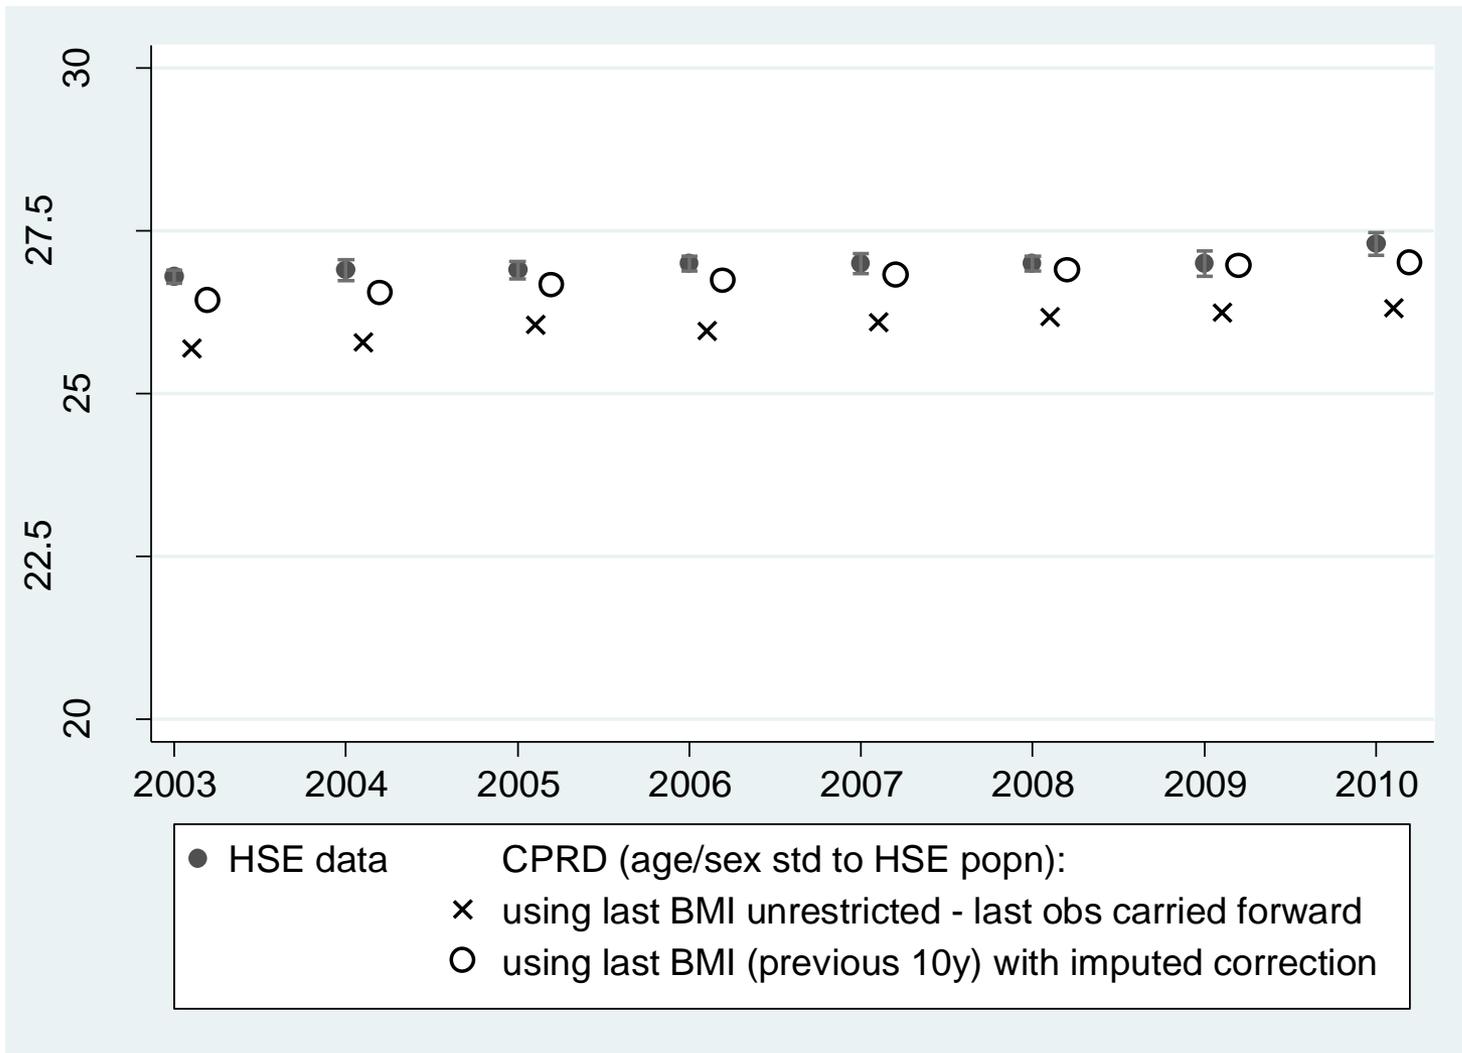

Age-standardised prevalence of overweight and obesity ages  $\geq 20$  years, by sex, 1980–2013

1. Herrett et al. Data Resource Profile: Clinical Practice Research Datalink (CPRD). *IJE* 2015 *In Press*.
2. Mathur R et al. Completeness and usability of ethnicity data in UK-based primary care and hospital databases. *J Public Health (Oxf)*. 2014 Dec;36(4):684-92.

# Mean body mass index (BMI) over calendar time comparing CPRD (English practices) with the Health Survey for England 2010 data

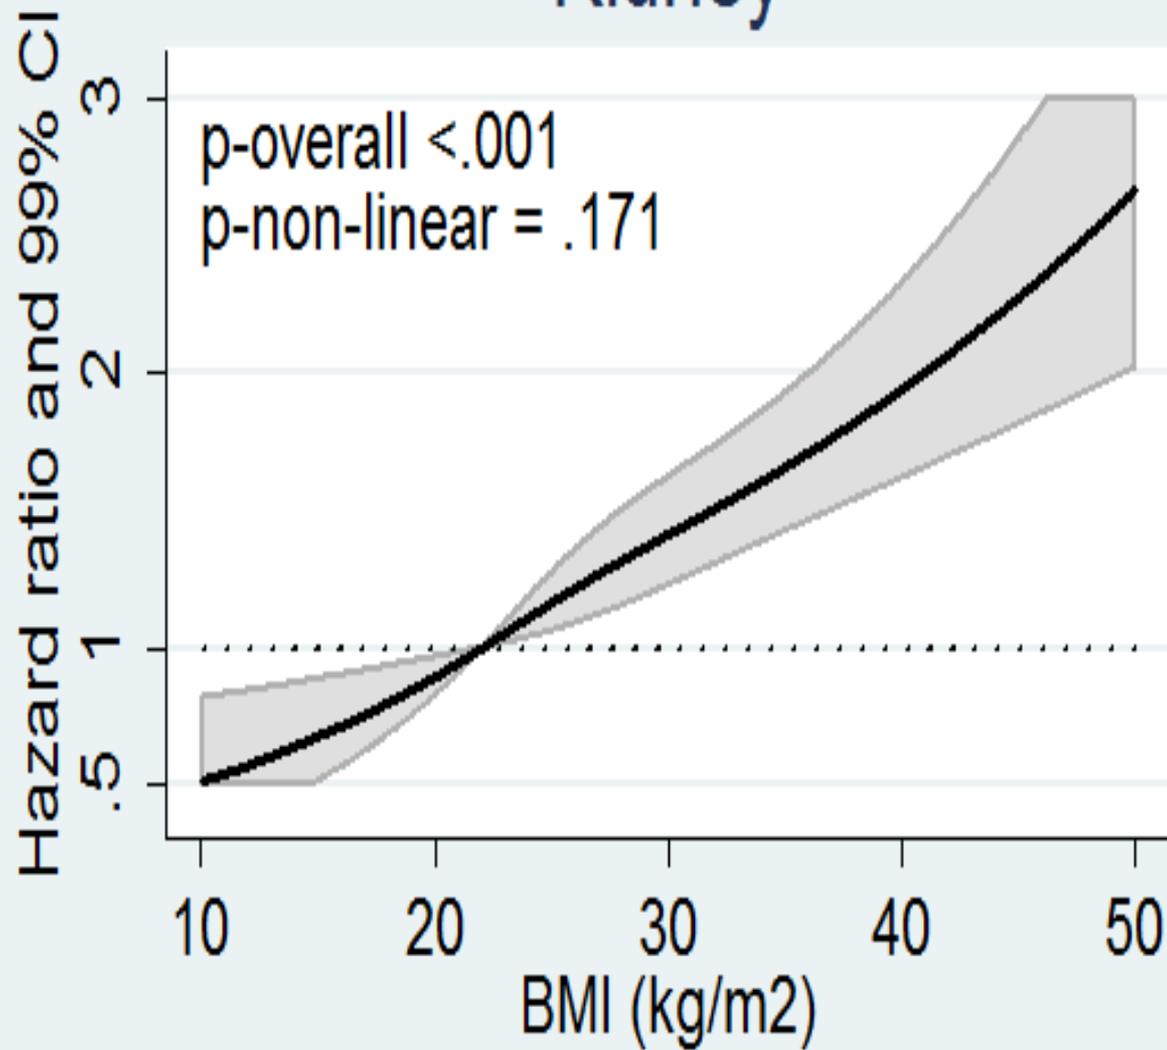

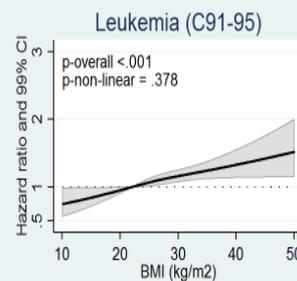

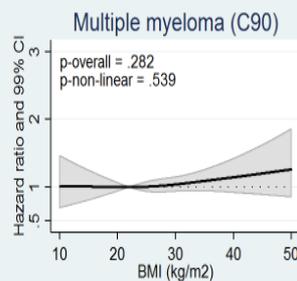

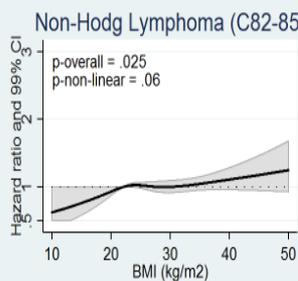

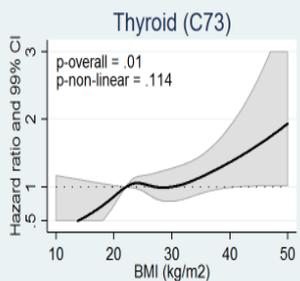

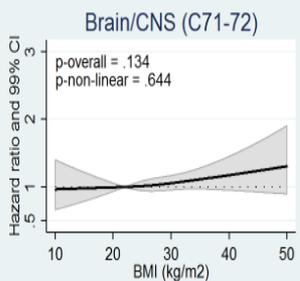

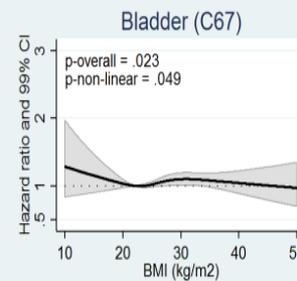

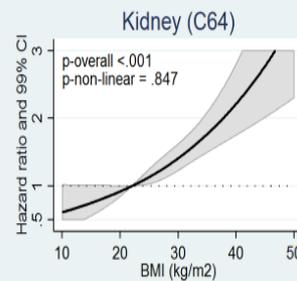

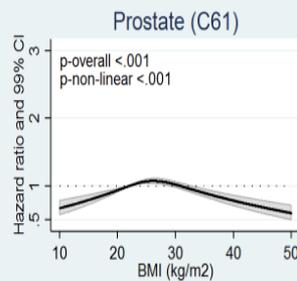

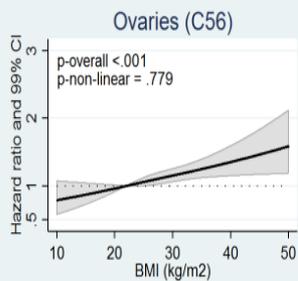

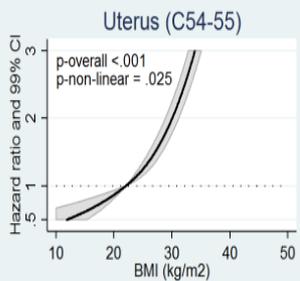

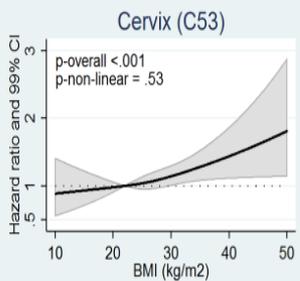

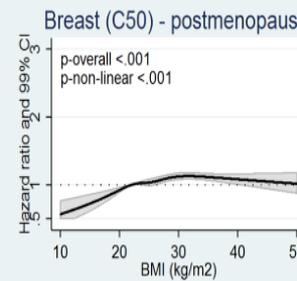

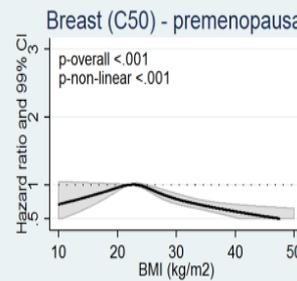

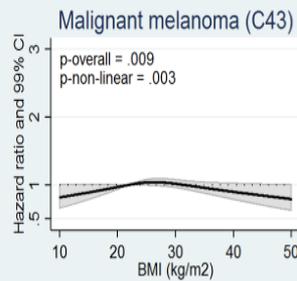

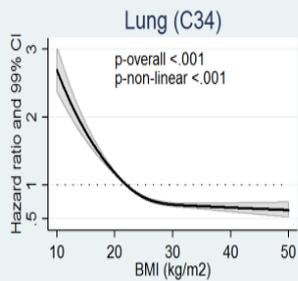

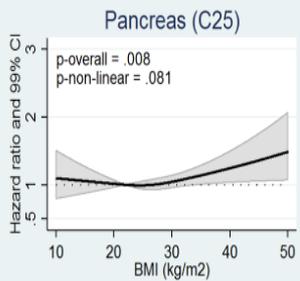

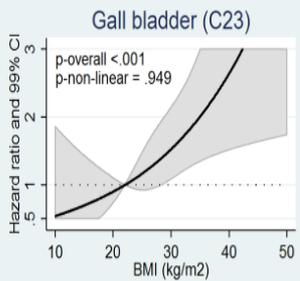

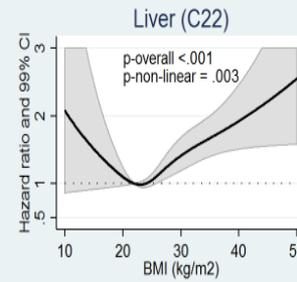

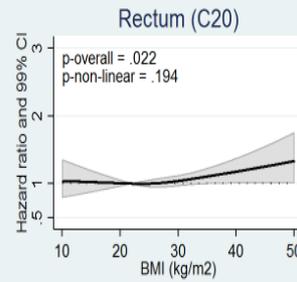

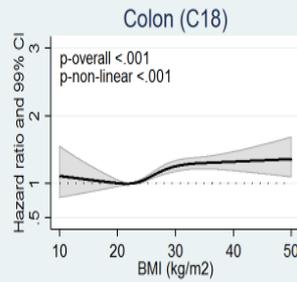

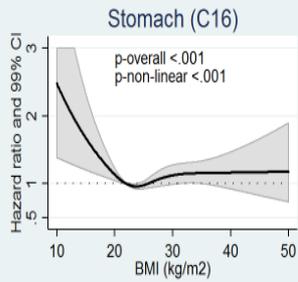

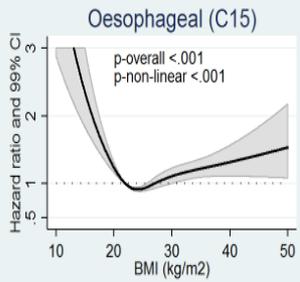

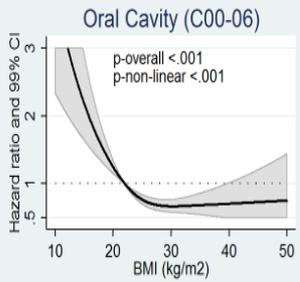

# Body mass index and cancer

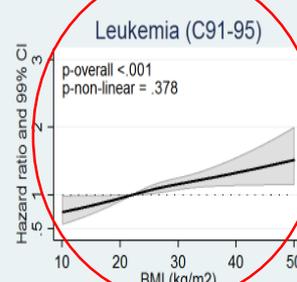

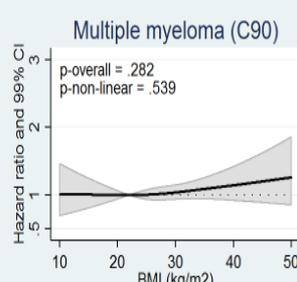

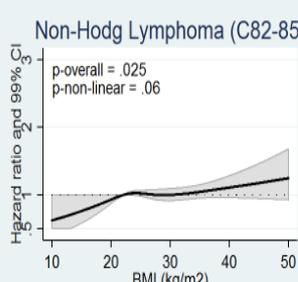

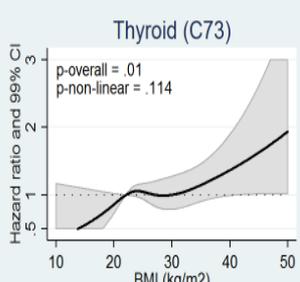

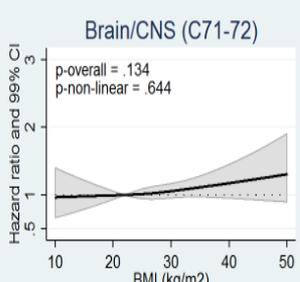

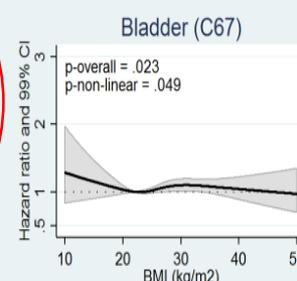

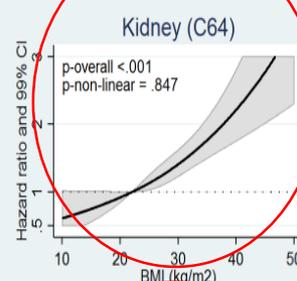

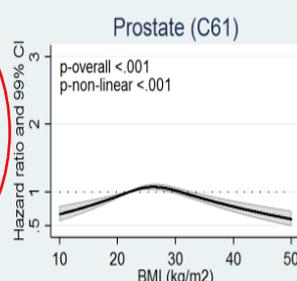

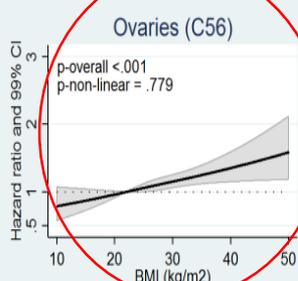

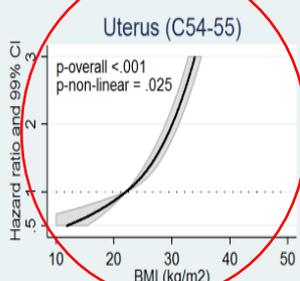

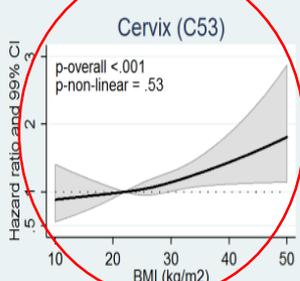

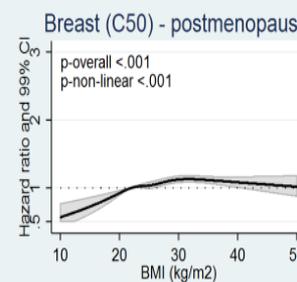

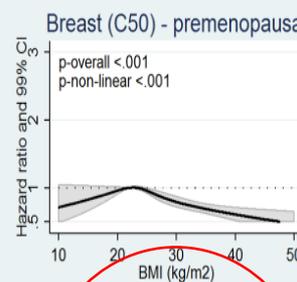

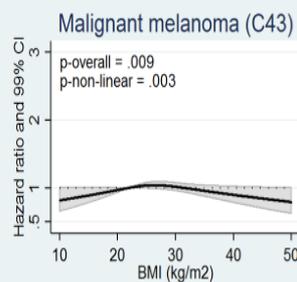

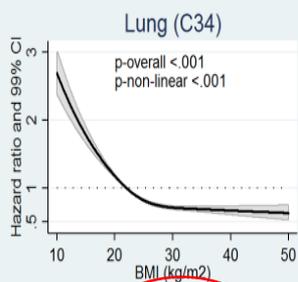

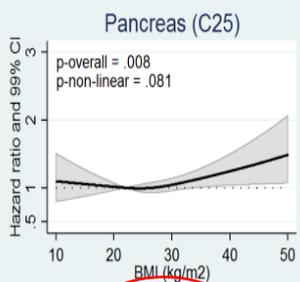

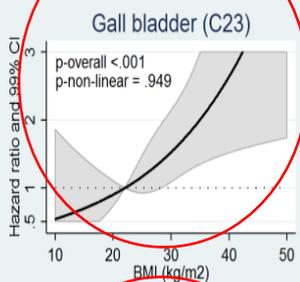

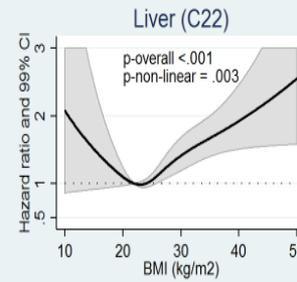

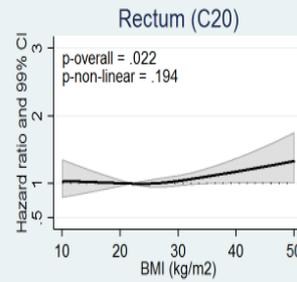

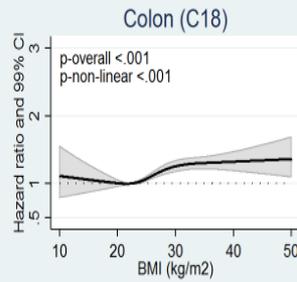

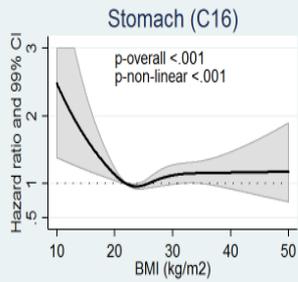

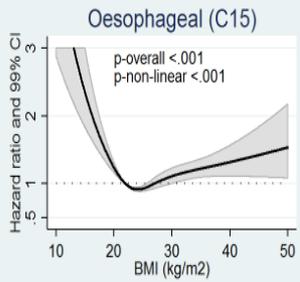

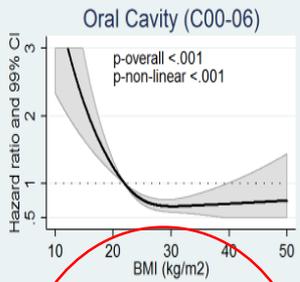

- Cohort study within the Clinical Practice Research Datalink (CPRD)
- 5.2 million people with BMI measures
- 33.9 million person-years of follow-up included
- 184,594 people (3.5%) experienced one of the 21 commonest cancers

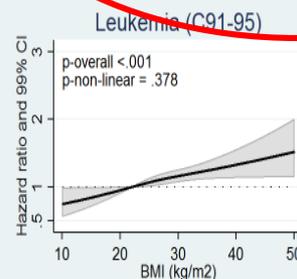

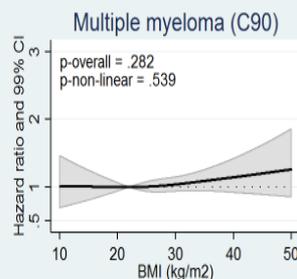

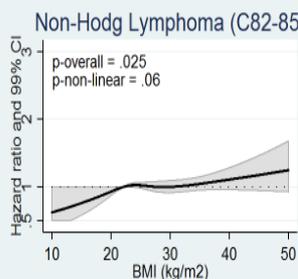

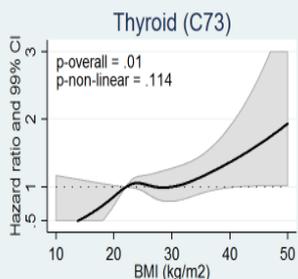

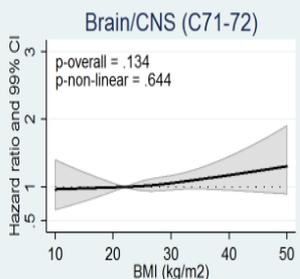

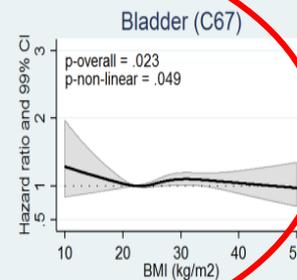

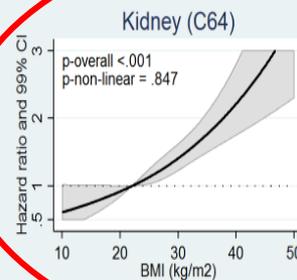

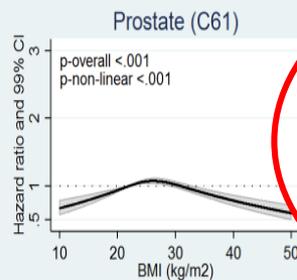

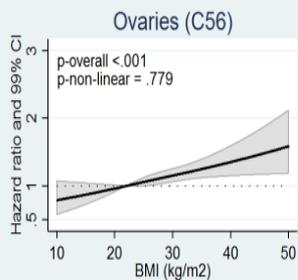

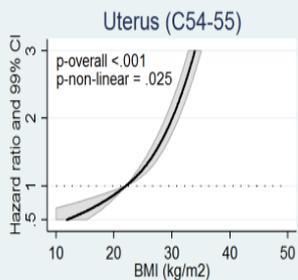

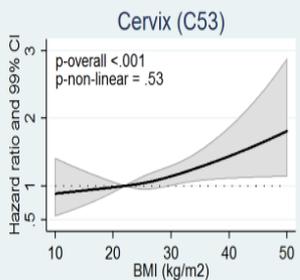

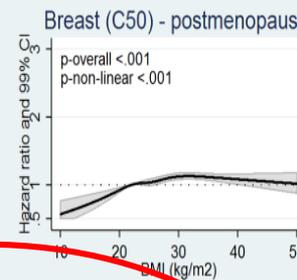

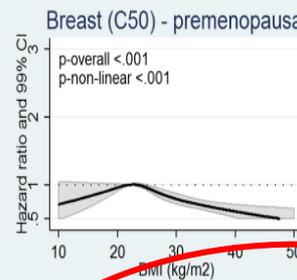

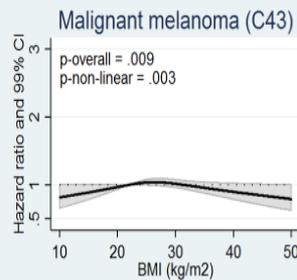

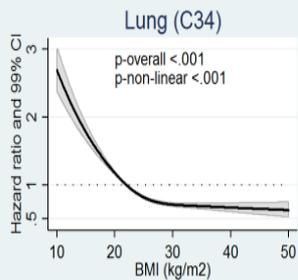

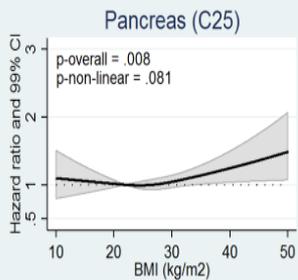

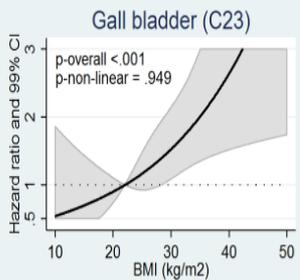

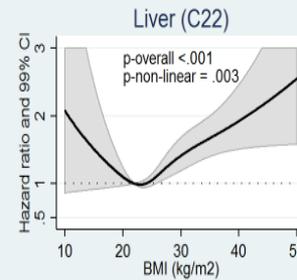

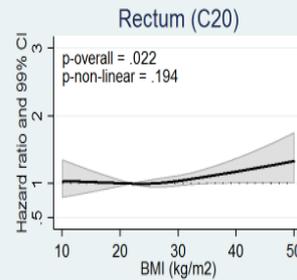

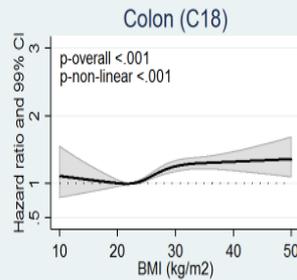

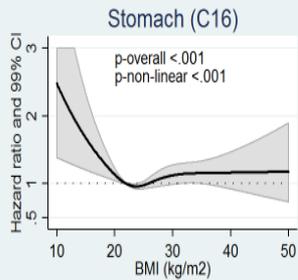

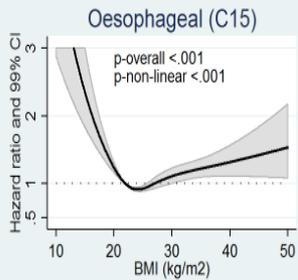

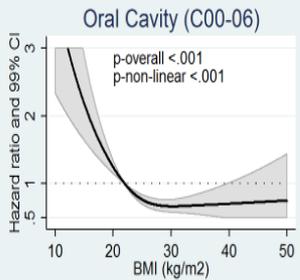

# Kidney

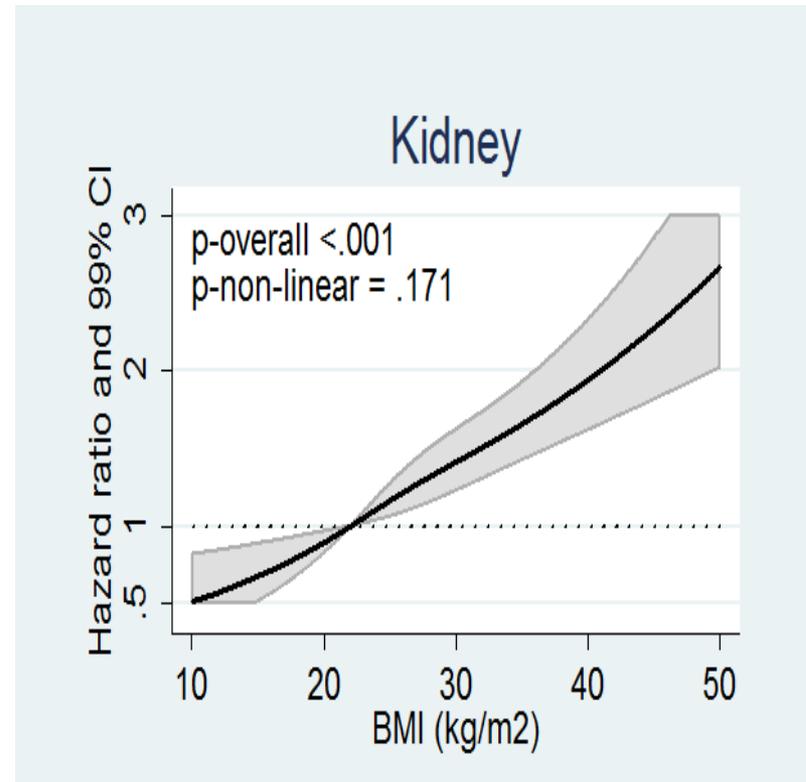

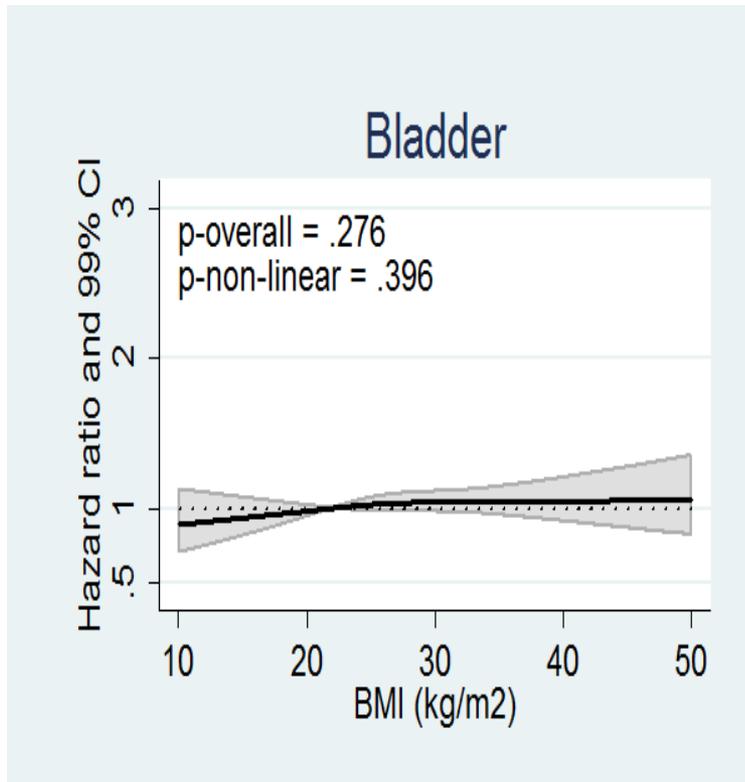

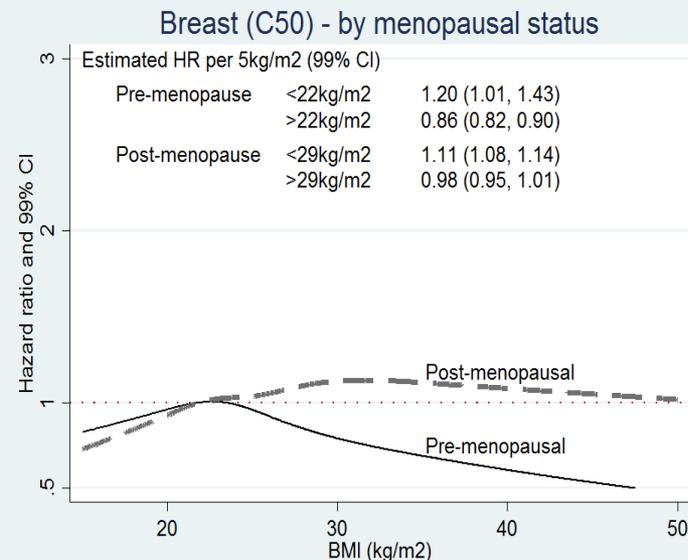

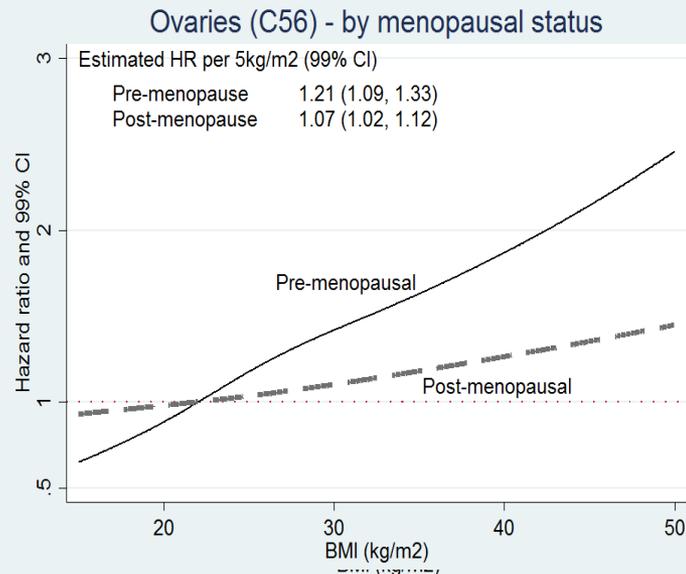

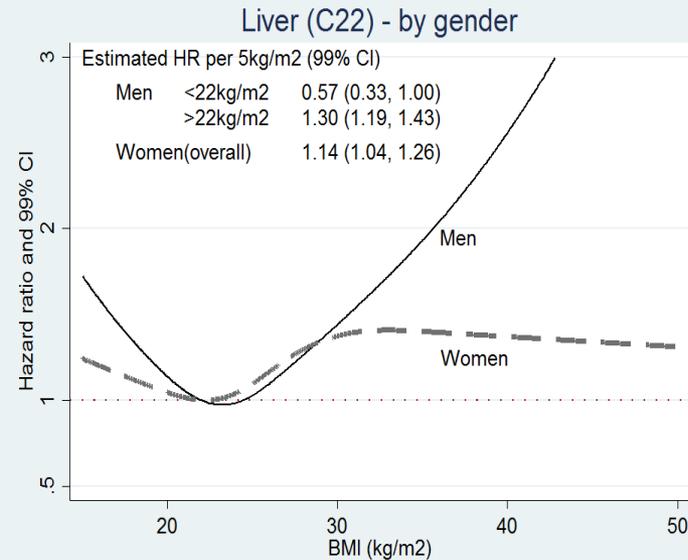

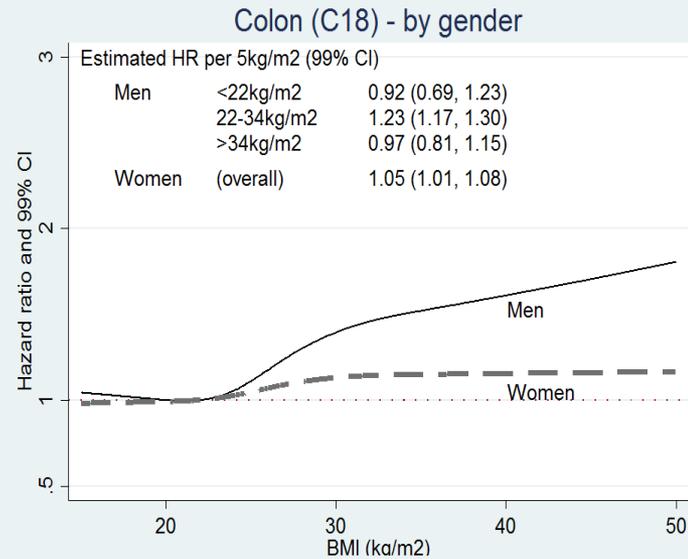

# Different causes

# Effect modification by gender, menopausal status

# Implications 1: public health

Assuming causality:

- for the 10 cancers showing a clear positive relationship, a 1 kg/m<sup>2</sup> population-wide increase in BMI (about the same as the last 10 years) will lead to:
  - 460,000 extra cancers worldwide

## Implications 2: biology

The heterogeneity in observed effects of BMI strongly suggests that underlying mechanisms vary by:

- gender
- menopausal status
- different tissues and organs

# The computerisation of health records → extraordinary opportunities for research

- Cheaper research
- Research that couldn't otherwise be done
- Better research

# What do we need?

- Expertise, optimal methods, and ensuring high data quality
- Confidentiality and security of data
- Maintaining public trust

## How are Schools of Public Health making use of new data sources?
